SOV/5474

PURPOSE: This handbook is intended for mining engineers and skilled personnel of the mining industry.

COVERAGE: Volume II of the handbook reviews various methods of underground mining and analyzes the basic principles underlying different types of ore mining operations. Parts I, VI, IX XI, and XV of this volume were written by L. Ya. Tarasov, Mining Engineer. L. Ye. Egel', Geological Engineer, also participated in writing Part I. Part II was written by A. M. Bybochkin, [Candidate of Geological and Mining Sciences] Part III by D. N. Ogloblin, Professor, Doctor of Technical Sciences, and M. G. Papazov, Candidate of Technical Sciences; Parts IV, V, and X were written by R. P. Kaplunov, Professor, Doctor of Technical Sciences; Part VII by V. V. Nedin, Professor, Doctor of Technical Sciences, and by Sh. I. Ibrayev, Docent, Candidate of Technical Sciences; Part VIII by N. N. Polyakov, Docent, Candidate of Technical Sciences (deceased) and by M. B. Udalkin, Mining Engineer; Part IX by A. M. Alyamskiy, Docent, Candidate

Title : Optical activity of gaseous methylvinylcarbinol

Periodical : Zhur. fiz. khim. 28/7, 1310 - 1312, July 1954

Abstract : A method of measuring the thermal process of optical activity in gaseous phase, in the ultraviolet zone of the spectrum, was developed. The optical activity of gaseous methylvinylcarbinol and the molecular constants of reversible isomers of this compound, were investigated and the results are given in tables. Two references: 1 USA and 1 USSR (1925 and 1954). Drawing.

TEXT: In November 1961, in Warsaw, Łódź and Poznań was organized an exhibition of geodetic instruments manufactured by the Hungarian optical enterprise MOM. The following system of instrument designation is adopted in Hungary: at first an abbreviated name is given (Te - theodolite, Ta- tachometer, Ni - level instrument), then precision class is denoted by a capital letter (A, B, C, D, E,), and at last, the next in turn number of design is given by Arabic numerals. The following instruments were exhibited: Te-B1 (0"25), Te-C1 (1"), Te-D1 (0!1), Ta-D1 (0!1, diagram type), Te-E4 (0!5) (Reading precision is indicated in parentheses, Reviewer), Ni-A1 (with a level, rms error per km $m = \pm 0.2 - 0.3$ mm), Ni-B3 (with compensator; $m = \pm 1.5$ mm), planetable with

B

TITLE: Large deflections of elastic-creeping circular membrane

SOURCE: Archiwum mechaniki stosowanej, v. 17, no. 3, 1965, 427-439

TOPIC TAGS: membrane buckling, stress load, creep characteristic, elastic material, ordinary differential equation, approximation method, continuous medium

ABSTRACT: A new method is used to solve the symmetrical circular elastic-creep²⁶ problem when applied to a circular membrane with large deflections. The strain rates for the membrane are described by

$$\dot{\epsilon}_{ij} = \Phi_E \dot{\epsilon}_{ij} + \Phi_C \dot{\epsilon}_{ij}$$

where Φ_0 is the fluidity given by

$$\Phi_C = \frac{3}{2} B \sigma_1^{-1}$$

The equation of equilibrium of the membrane is expressed nondimensionally by

$$\frac{d\bar{w}}{d\bar{r}} = -\frac{\bar{q}}{\bar{r}}$$

The governing equation of elastic-creep motion is obtained in the form

Card 1/3

L 00352-66

ACCESSION NR: AP5021704

$$8(z'' + \alpha \Omega^{\frac{n-1}{2}} z') \varrho + \alpha(n-1) \Omega' \Omega^{\frac{n-1}{2}} \left(4z' - 3\frac{z}{\varrho}\right) \varrho = 2\gamma z \left(\frac{\varrho}{z}\right)^\alpha,$$

where

$$\alpha = \frac{B}{A} C^{n-1}, \quad \gamma = \frac{P}{AC^2}, \quad \Omega' = \frac{d\Omega}{dq},$$

and the solution is given in the form of a double power series for a hinged membrane or

$$z = \sum_{l=0}^{\infty} \sum_{k=0}^{\infty} z_{lk} \alpha^k \varrho^{l+1},$$

$$z_{lk} = z_{lk}(t), \quad \alpha = \frac{B}{A} C^{n-1};$$

where α is a small parameter. The boundary conditions for arbitrary t are given by

$$\dot{u}(1) = 0, \quad \text{or} \quad \left[\left(4z' - 3\frac{z}{\varrho}\right) + \alpha \Omega^{\frac{1}{2}(n-1)} \left(4z' - 3\frac{z}{\varrho}\right) \right]_{\varrho=1} = 0;$$

$$\bar{w}(1) = 0;$$

$$(\sigma_r - \sigma_\theta)_{\varrho=0} = 0, \quad \text{or} \quad \left(z' - \frac{z}{\varrho} \right)_{\varrho=0} = 0$$

and the initial conditions by

$$\sigma_r|_{t=0} = \sigma_{r0}, \quad \text{or} \quad z|_{t=0} = \sum_{\varrho=0}^{\infty} z_{\varrho 0} \varrho^{\varrho+1} = z_0;$$

Card 2/3

L 00352-66

ACCESSION NR: AP5021704

2

$\bar{w}|_{z=0} = \bar{w}_0$

It is shown that the method is applicable to circular plates and to certain shells of rotation. The effectiveness of the method consists in reducing the time-dependent solution to a recurrence set of linear differential equations. Since the method involves a "small parameter," the solution is limited to the cases where the creep deformation does not exceed the elastic deformations. Orig. art. has: 70 equations.

B

TITLE: Elastic analog in the general case of a geometrically nonlinear membrane subjected to creep

SOURCE: Archiwum mechaniki stosowanej, v. 17, no. 4, 1965, 593-600

TOPIC TAGS: creep mechanism, tensile stress, thermal stress

ABSTRACT: An elastic analog exists in the geometrically nonlinear creep problem of a circular membrane because in the two fundamental equations of the problem the variables are separable. The one independent of time is formally analogous to the elastic instantaneous problem. The general law for a membrane undergoing creep is

$$\dot{\epsilon}_{ij} = \Phi_c s_{ij},$$

where ϵ_{ij} are the components of strain rate tensors, s_{ij} are those of the stress deviations, and Φ_c is the liquidity as a function of the state of stress. According to the law of steady state creep, the liquidity is a power function of the stress intensity

σ_i

$$\Phi_c = \frac{3}{2} B \sigma_i^{-1},$$

Card 1/2

L 30004-66

ACC NR: AP5024315

where B and n are constants. The equilibrium equation and the compatibility equation together with boundary and initial conditions, are used to formulate the creep problem for a geometrically nonlinear membrane of any simply connected normal contour. The existence of an elastic analog is shown by the separation of linear and time variables. Orig. art. has: 2 figures, 46 formulas.

TITLE:

A Study of Clostridium Perfringens Strains (Type D) Isolated During Infectious Enterotoxemia.

PERIODICAL:

Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1960, No. 5, pp. 64 - 68

TEXT:

A study was made of various strains of Clostridium perfringens type D to obtain a diagnostic antitoxic serum for this type. The strains available had been isolated from the soil and from the corpses of sheep. The epsilon-prototoxin was activated either with pancreatic solution (or trypsin) or by the toxin neutralization reaction, with specific antitoxic sera to Clostridium perfringens types A, B, C and D. It was found that Clostridium perfringens type D's ability to produce epsilon-prototoxin does not depend on the production of other toxins and may be lost by long storage on synthetic media. This is proved by the fact that classical type D strains, isolated by Bennets and obtained from France, had lost their power to synthesize epsilon-prototoxin. Toxoids for killing animals against infectious enterotoxemia, recorded in southern

AUTHOR: Bychenko, B.D.

TITLE: A Study of Clostridium Perfringens Strains (Type D) Isolated
During Infectious Enterotoxemia.

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1960,
No. 5, pp. 64 - 68

TEXT: A study was made of various strains of Clostridium perfringens type D to obtain a diagnostic antitoxic serum for this type. The strains available had been isolated from the soil and from the corpses of sheep. The epsilon-prototoxin was activated either with pancreatin solution (or trypsin) or by the toxin neutralization reaction, with specific antitoxic sera to Clostridium perfringens types A, B, C and D. It was found that Clostridium perfringens type D's ability to produce epsilon-prototoxin does not depend on the production of other toxins and may be lost by long storage on synthetic media. This is proved by the fact that classical type D strains, isolated by Bennets and obtained from France, had lost their power to synthesize epsilon-prototoxin. Toxoids for immunizing animals against infectious enterotoxemia, recorded in southern

Kazakhstan, should be prepared from activated epsilon-prototoxin of Clostridium perfringens type D. For preparing therapeutic and diagnostic antitoxic serum against Clostridium perfringens type D, or for vaccines against infectious enterotoxemia, the following Soviet strains are recommended: 63 zk, 68 zk, 1k-D, 30 and 45. There are 3 tables and 14 references, 5 of which are Soviet, 8 English and 1 German. ✓

TITLE: Complex nature of Cl. perfringens somatic antigens A, B, C, D, E, and F

SOURCE: Journal mikrobiologii, epidemiologii i immunologii, no. 2, 1965, 131-135

TOPIC TAGS: Cl. perfringens, antigen, extraction method, agglutination test, precipitation, serologic test

ABSTRACT: The contradictory nature of literature data on the specificity of Cl. perfringens somatic antigens A, B, C, D, E, and F prompted the present comparative study of all six antigens. The results obtained from initial and subsequent studies are presented.

The antigens were prepared by the method of Bychenko et al. (1965) and by Miller's method (1965). They were tested by agglutination, precipitation, and a serologic test.

agar method. Findings show that there are considerable differences between the various *S. paratyphi* somatic antigens. The antigenic structure of the various strains of type II and strains of type I serological reaction results coinciding regarding the antigenic structure. It appears that the specificity of the antigenic structure is determined by the entire complex of cell antigens. has: 1 figure.

Title : An Experiment in the Control of the Pear Bug.

Orig Pub : Sad i ogorod, 1957, No 5, 56-57

Abstract : The following measures for the control of the pear
bug are recommended on the basis of a 2-year ex-
periment: re-spading the circles around the
trunks after the fall of the leaves; dusting the
trunks and the circles around the trunks in early
spring with 25% hexachlorocyclohexane (HCH) dust,
60-70 g per tree; during the emergence of first
generation larvae, dusting with a 25% HCH dust,
15-20 kg/ha. Dusting the infected sections with
HCH destroyed 95-100% of the larvae. Dusting

TITLE: ~~On the Coefficient of Friction in the Threads of Bolts~~ (O koef-fetsiyente treniya v rez'be boltov)

PERIODICAL: Sb. nauchn. rabot. Vyssh. shkola promysl. kooperatsii, 1957, Nr 2, pp 35-53

ABSTRACT: The author arrives at the following conclusions: 1. In calculating the axial force required to ensure a suitable pressure on the bolted element, it is advisable to assume a general (nominal) friction coefficient of 0.18 to obtain dependable results. 2. In design calculations relative to flange bolts the friction coefficient should be assumed to be 0.14.

TITLE: The Experimental Gas Turbine Plant of NZL

PERIODICAL: Tr. Nevsk. mashinostroit. z-da, 1957 (1958), No. 1, pp. 211-226

TEXT: An experimental gas turbine power plant was built at NZL in 1945-1948. At this plant a single-shaft ГТ-550 (GT-550) unit was installed working on an open cycle with regeneration (550°C gas temperature, 3.5 atm pressure). In 1955, the unit was converted to a ГТ-700 (GT-700) two-shaft installation (700°C gas temperature). The plant was in operation for 2,500 hours with 130 starts. The GT-550 with a capacity of 840-1,000 kw has 5 reaction stages $\alpha_1 = \text{const}$, $\beta_2 = \text{const}$, $u/c_0 = 0.56-0.63$. The axial compressor has 16 stages with a 50% reaction. The adjustment of the compressor was performed during the tests. The stage characteristic on which the calculation of the compressor of the industrial ГТ-600-1.5 (GT-600-1.5) was based, was plotted on the basis of these

investigations. The nonuniform distribution of temperatures over the turbine casing and great temperature stresses in the rotor bore necessitate a preheating of the installation for 60 - 80 minutes. Characteristics of the turbine unit at different operating conditions are given. Changes of the outside air temperature from +20°C to -20°C do not affect the specific fuel consumption, but the power rises by 1.5 times. The two-shaft GT-700 unit was designed on the basis of the GT-550 by adding a superimposed, single stage turbine with a 700°C inlet temperature and a high-pressure compressor.

TITLE: Stationary NZL Gas Turbines

PERIODICAL: V sb.: Ispol'sovaniye gaza v teplosilovyykh ustanovkakh. M.-L., Gosenergoizdat, 1957, pp 114-121

ABSTRACT: Neva Machine-Building Plant imeni Lenin builds 1.5-6-Mw gas-turbine units. All units built by this plant have the simplest scheme with a developed regeneration and a turbine-entrance temperature of 600°C. The first GT-600-1.5 industrial unit (600°C, 1.5 Mw) operates on various grades of heavy liquid fuel. The FG-50000 gas-turbine-compressor (reference capacity 2.5 Mw) is intended for operation on a low-calorie gas from underground gasification. Its axial extraction-type compressor ensures delivering 50,000 m³/hr of air into the drill-hole at 2.2-atm. The GT-600-6 unit operates on blast-furnace gas with $Q_P^H = 630$ kcal/kg and drives a 6-Mw

Card 1/2

Stationary NZL Gas Turbines

SOV/112-59-4-6591

generator. Use of a double housing and runner air cooling permitted considerable savings on austenite steel without any appreciable reduction of efficiency or reliability of the machine. A GT-700-4 unit (700°C, 4 Mw) has been developed for gas-pumping stations; its scheme is similar to that of GT-600-1.5, but it has, in addition, a superimposed turbine. New blading in its gas-flow path ensures a high efficiency.

TITLE: Certain problems connected with the carrying out of arithmetic operations in machines working with ten positional elements

B

SOURCE: Ref. zh. Matematika, Abs. 6V326

REF SOURCE: Sb. Vopr. teorii elektron. tsifrovyykh matem. mashin. Vyp. 8, Kiyev, 1965, 65-75

TOPIC TAGS: arithmetic unit, computer coding, computer design, computer theory

ABSTRACT: The simplicity of realization of binary elements and the shortcoming peculiar to the binary systems of calculus quite often induced the designers to leave the decimal calculus and utilize binary-decimal codes although this leads to an increase in size of equipment by some 15—20%. The use of multipositional elements, which in realization complexity are comparable with the binary ones, permits not only to avoid these expenditures but also to reduce the equipment by, for instance, reducing the length of registers. During the utilization of ten-positional elements, a certain complexity of schematic realization of the formation of auxiliary and inverse codes is encountered. For the representation of numbers it is expedient to utilize direct codes; the code of the multiplication and fractional sign is fixed by

Card 1/2

UDC: 681.142.001

U 00588-67

ACC NR: AR6029275

the sum of the digits of the numbers signs. The sign of the arithmetic operation during the combining of two numbers is determined by the sum over the modulus 10 of the sign codes of the components and the sign code of the algebraic operation. Here it is comparatively simple to materialize the comparison of two numbers if, for instance, the phase pulse representation is utilized. The methods for the carrying out of the decimal composition and subtraction differ very little from the binary ones as far as new ideas and principles are concerned; however, as the result of a more economical representation of numbers their subsequent processing is accelerated. The paper describes in detail certain most specific methods of decimal multiplication. The multiplication by means of consecutive addition (a simplicity of realization at a not too high speed), the multiplication by means of subtraction, and the multiplication using the multiplication matrix. Estimates are given concerning the speed of multiplication for each of the three methods: during parallel summation $10nr$, $6nr$, and $5nr$; for consecutive summation $4.5n^2r$, $2.5n^2r$, and $n(n+1)r$ respectively, where n is the number of digits of the comultiplier and r the duration of the cycle of addition and shift. Corresponding estimates for analogous binary multiplication ($9.9nr$ and $10.9n^2r$) permit the comparison of these two methods.
